
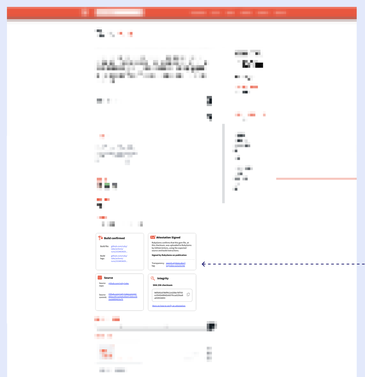
An example of a row of cards that fills the width of the main page section.

Note: In this example, there is no checksum/SHA container included in the design.

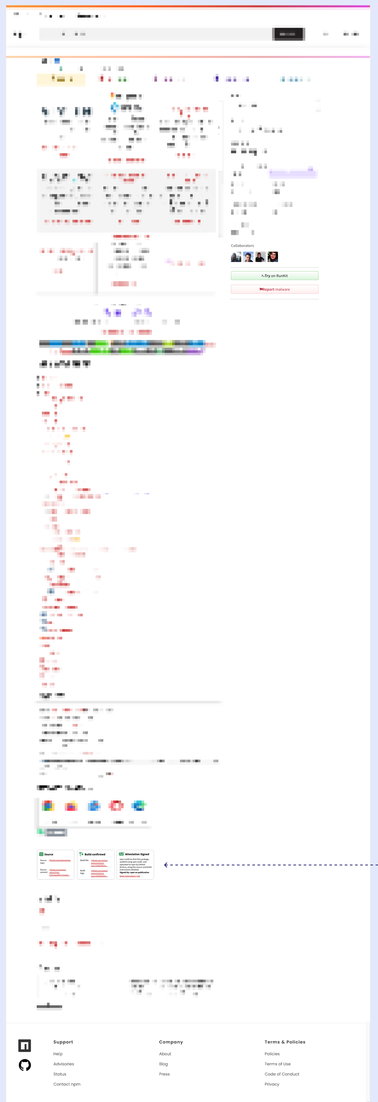


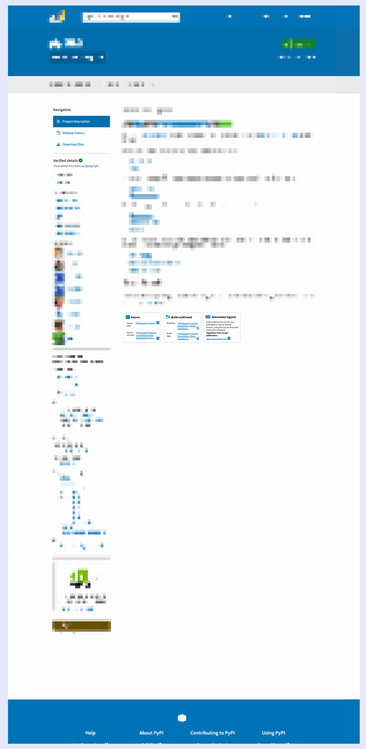
Example of a two horizontal stacking of cards. In this example, the Integrity section includes checksum/SHA information, which helps visually balance the design.

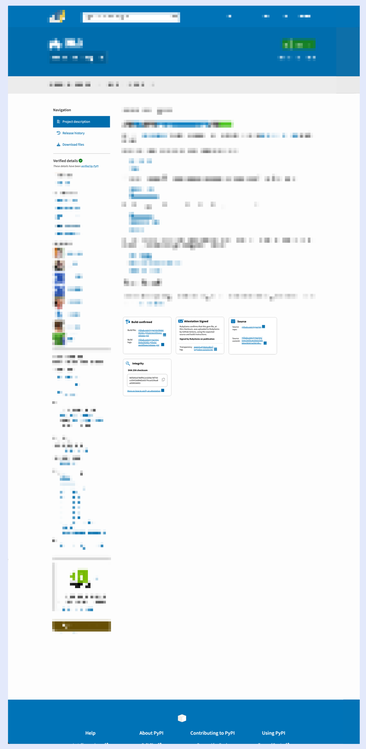
Platforms can choose to make a single container span two spaces. There is no strict rule for how wide or tall box containers should be, but it is strongly advised not to have distances of different heights next to each other (see diagram below).

Good placement/ sizing

Bad placement/ sizing



Note: the cards on either sides fill the width of the available page space, or they can occupy only the minimum width necessary for accessible visibility of information.




Example of a single card stacked below three standard card. These three horizontal cards also occupy the minimum width space for available information.
